SAN BERNARDINO COUNTY

FIRST5
SAN BERNARDINO

Introduction and Instructions for Use:

First 5 San Bernardino works to promote, support and enhance the health and early development of children prenatal through age five and their families and communities in San Bernardino County.

The purpose of this toolkit is to help you and your organization share valuable information about dental hygiene for young children. You will find a variety of tools that are designed to help you get the message out there about oral health. The content in this toolkit can be used at any time.

Below are some of the main topics we will cover:

- Tooth decay is the most common chronic childhood disease
- Baby's 1st dental visit should be at 1st birthday or 1st tooth
- Healthy baby teeth form healthy adult teeth
- SmileSBC.com is a great place to find a dentist nearby that is affordable and accessible

Toolkit Content:

- Sample newsletter on the importance of oral health in young children
- English and Spanish social media posts and graphics

'Little Teeth, Big Responsibility' Campaign Emphasizes the Importance of Oral Health in Children Under 5

Did you know that over 60% of kindergarteners in San Bernardino County have experienced dental decay? The CDC reports that tooth decay, while preventable, remains the most common chronic childhood disease.

[Smile San Bernardino County](#) (Smile SBC) in the Department of Public Health and [First 5 San Bernardino](#) have teamed up to relay the message about the importance of early dental visits with their "Little Teeth, Big Responsibility" campaign. The campaign includes billboards and online advertising in San Bernardino County, as well as updated website information and social media content.

Baby teeth are very important to your child's health and development. They help them chew, speak and smile – and they hold space in their jaws for permanent teeth that are growing under the gums. When a baby's teeth are lost too early, the permanent teeth can drift into the empty space and make it difficult for other adult teeth to come in. This can make teeth crooked or crowded and can negatively impact a child's speech development.

Your child's first visit to the dentist should be by age 1 – or even better, by their first tooth – and then again, every six months. Developing good oral habits at an early age by brushing, flossing, eating healthy and visiting the dentist regularly helps children get a great start on a lifetime of healthy, pain-free teeth and gums.

"The 'Little Teeth, Big Responsibility' campaign is very important because oral health habits begin at an early age," said Karen Scott, executive director of First 5 San Bernardino. "We want to encourage parents to put their children's oral health at the top of their lists and make regular dentist visits a priority," Scott concluded.

Luckily, starting early helps a child get comfortable with the sights and sounds of a dental office. Besides checking for cavities and other problems, dentists will show you how to clean the child's teeth properly and how to handle habits like thumb-sucking.

Here are some tips on how to take good care of your baby's teeth:

- Wipe gums twice a day. Use a soft, clean cloth to help wipe away cavity-causing sugars.
- Once baby teeth come in, brush twice a day with a small-bristled toothbrush.
- Eat healthy foods and limit sugary drinks.

Want to find a dentist but don't know where to start? Visit SmileSBC.org for a list of affordable dentists in your area. You can also find free resources, tips and tricks, and more information about taking care of your child's oral health. Remember, healthy baby teeth form healthy adult teeth!

5. English: When baby teeth are lost too early, the permanent teeth can drift into the empty space and make it difficult for other adult teeth to come in. This can make teeth crooked or crowded and can negatively impact a child's speech development. Starting babies off with good oral care can help protect their teeth for life. [SmileSBC.org](https://www.smilesbc.org) #First5SanBernardino #SmileSBC

Spanish: Cuando los dientes de leche se pierden demasiado pronto, los dientes permanentes pueden moverse en el espacio vacío y dificultar la entrada de otros dientes adultos. Esto puede hacer que los dientes estén torcidos o mal alineados y puede afectar negativamente al desarrollo del habla del niño. Comenzar a cuidar a los bebés de manera adecuada puede ayudar a proteger sus dientes por vida. [SmileSBC.org](https://www.smilesbc.org) #First5SanBernardino #SmileSBC
